

ABSTRACT

((A brush for applying coatings to surfaces has specific positioned bristles. The stiffer bristles are shorter than the weaker bristles; the thinner bristles are longer than the thicker bristles; the straight bristles are shorter than the split bristles.))

A paintbrush having an elongated handle has a brush head containing a continuum of bristles configured from a multiplicity of primary short bristles and secondary longer bristles with split and smaller diameter distal extremities. The effect of the primary shorter bristles is to release coating liquid onto the longer bristles during bending. The effect of the distal end of the secondary longer bristles is to function as smoothing of the discharged coating in lieu of physical stroking requiring human muscular strain.
